The extreme male brain theory of autism

Simon Baron-Cohen

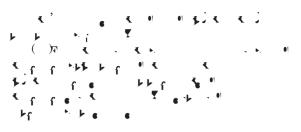

The key mental domains in which sex differences have traditionally been studied are verbal and spatial abilities. In this article I suggest that two4snv66666666660 & neglectuggy adits dif(understalimisihum than sex differences have traditionally better than as those individuals in whom systemising is significantly better than empathising, and the female brain is defined as the opposite cognitive profile.
